

DarkSwap Litepaper

Go dark. On NEAR Intents.

A privacy terminal built on NEAR Intents.

The goal: cross-chain privacy without specialist knowledge.

01 Private swaps

Live

Private swaps from Solana, sent from your own wallet.

Available today.

02 Dark pool on NEAR

Next

A confidential balance you can swap inside.

Gate: NEAR access + integration. Target: late October 2026.

03 ZK pools

Built

Zero-knowledge shielding on Solana, Ethereum and Base.

Gates: public testnets, external setup ceremony and audit.

Live Real funds today. **Next** Designed; target can move.

Built Running on local chains.

Private swaps

Live

You stay in control from start to finish.

Nothing moves at review. DarkSwap never holds your funds or signs for you.

How it routes

Routing infrastructure comes from NEAR Intents and Houdini. DarkSwap builds the experience around it.

Privacy swap uses the NEAR Intents 1Click API with confidential handling requested, or a partner provider with its own terms and costs. Each order has its own quote. Recovery follows the provider's process.

Fees

0.40% of input 0.20% DarkSwap + 0.20% NEAR Intents 1Click

Shown in every quote. Provider and network costs apply on top.

What stays visible

This is private routing, not zero-knowledge shielding.
Your Solana deposit is public.
Routing providers can see some details of the swaps they handle.

Dark pool on NEAR

[Next](#)

A confidential balance to hold, swap inside and withdraw from.

You authorize each action

Every action uses a signed intent from your own wallet.
DarkSwap does not hold your keys.

How the privacy works

Balances and swaps are planned on a NEAR private shard run by permissioned validators.

It uses encryption and restricted validator access, not ZK proofs.
The shard's operators can see what the public cannot.

Path to beta

Dependency	Where it stands
NEAR access	Not secured yet. NEAR must enable access.
Integration	DarkSwap must complete the integration.
Target	Late October 2026. No confirmed launch date.
Initial beta	Small amounts of DarkSwap's own funds on mainnet.

ZK pools

Built

DarkSwap's ZK tier runs end to end with real proofs on local chains. Solana, Ethereum and Base; not deployed on a public network yet.

Action	What it does
Shield	A public deposit creates an encrypted note.
Private send	Moves value between notes, with a ZK proof built on your device.
Unshield	Withdraws to a public address.

One asset per transaction. Swaps inside the pools are not built yet.

Three gates before user funds

Internal reviews do not replace the independent audit.

Development preview

Do not deposit real funds.

Until all three gates are complete, darkswap.app/pool is a local preview. It uses development proving keys, which are not secure.

Where things stand

Item	Status
Code release	Waiting on licensing decisions.
Audit	Independent audit being pursued; no firm confirmed.
Relayer	One, run by DarkSwap. If down, self-submitted withdrawal is possible, but reveals your sending wallet.
Recovery	Frontend-independent recovery is designed; the standalone tool is not finished or public.
Solana upgrades	Upgradeable. Delayed multisig or revoking authority remains undecided.

\$DARK

Live

Holder rewards and treasury liquidity.

When creator fees are received, they are split in two.

50%

Qualifying holders

Paid in wNEAR.

50%

Creator-wallet treasury

Buys ZEC tokens on Solana.

Term	Detail
Payout times	6 a.m. and 6 p.m. Pacific time; adjusts for daylight saving.
Snapshot	A fresh snapshot at each payout.
To qualify	At least 100,000 \$DARK in that snapshot; exclusions apply.
Claim step	None. Rewards are sent directly to holders.

Every payout is recorded at rewards.darkswap.app.

Rewards come only from creator fees received, not from user deposits, trading volume or all project revenue.

Past payouts do not promise future ones.

Holding \$DARK is not a claim on project fees.

One ZEC-token loyalty award was completed on October 5, 2026.

Further ZEC awards need separate approval.

ZEC-DARK liquidity

Meteora liquidity on Solana, funded from the treasury half of creator fees.

Separate from payouts and the NEAR dark pool. It is not shielded.

The numbers so far

Verified public figures for completed swap volume and settled revenue are not available yet.

\$DARK trading activity is not a measure of product adoption.

Configured and protocol-reported

Figure	How to read it
0.20%	DarkSwap's configured swap-fee share, not earnings.
99.9%	Creator-funded ZEC-DARK liquidity, as reported by the protocol. Dated rewards-console receipts do not yet reconcile to the exact reported totals.
1%	Meteora base trading fee. Dynamic fees may also apply.
10%	LP fees configured to compound into the pool. A setting, not a return rate.

Creator-held liquidity includes vested and permanently locked portions. Funding is not ownership or a withdrawable balance.

The ZEC token

ZEC here is a Solana token, not native or shielded Zcash.
 Backing and redemption have not been independently audited.
 Its mint authority remains active.
 Native Zcash integration is being explored.

Proposed: usage feeds liquidity

Future ZK pool fees would buy ZEC and \$DARK and add them as liquidity.
 The contracts are not written. This proposal is not guaranteed.
 Operating-cost reserves and a possible swap-subsidy trial are not funded.

Risks & what's next

Risks and dependencies

Area	What remains
Execution	NEAR tiers depend on shard operators, provider availability and provider terms. Network and provider risks remain.
ZK correctness	Correct contracts and proofs, a secure setup, asset behavior and deployment controls remain critical.
Linkability	Public-chain amounts, timing and outside records can link activity. A small pool offers fewer unrelated transactions.
Market & legal	Market and legal risks remain. No legal opinion obtained.

What's next

Targets move. The gates do not.

When	What
Today	Private swaps, wNEAR payouts and Meteora liquidity.
Next	NEAR confidential balances; access and integration gate (p. 3).
Later	ZK pools, after all three security gates (p. 4).

Open decisions

Ownership of liquidity funded by future fees.

Terms of the NEAR dark pool agreement.

Multisig signers.

Audit, licensing and Solana authority decisions: page 4.
